

THE IDEAL THIRST QUENCHER

Humana Baby Water can be given to babies to drink without the need to boil it first thanks to the sterile bottling process. Incidentally it is also suitable for preparing bland diets for adults as well as coffee and tea. Since it is particularly low in pollutants compared to a lot of tap water. An advantage many parents consider very important in the first few months of their baby's life. The quality of Humana Baby Water is constantly monitored by means of extensive analyses.

Baby Water

Humana Baby Water – a summary

- The Baby Water is filtered and prepared using the most modern technology.
- Its composition is designed for the delicate organism of infants and toddlers.
- Humana Baby Water is absolutely without taste.
- Its sodium content is significantly below the recommended amounts for water used in preparation of infant formula.
- Any pollutants from the environment that may be present, e.g. nitrate, copper or lead, have been filtered out permanently so that they are below the detectable limit.
- Additional boiling is no longer necessary, since Humana Baby Water is bottled in a sterile environment.

Carefully monitored quality

Humana Baby Water is cleaned in an extensive production process with two-stage reverse osmosis. In this process tap water is forced through a very fine-pore membrane under high pressure. The substances released in the water are retained to 99%, while the cleaned water passes through the separation layer. We perform this process a second time to ensure the quality of the product. A largely salt-free product water is the result. Then a standard hardening process with calcium carbonate takes place.

Preparation of baby formula with Humana Baby Water

Humana Baby Water does not need to be boiled first for several minutes like normal tap water when used to mix infant formula, but just needs to be warmed up to the recommended temperature for preparation. Furthermore you will avoid problems that may come from hard tap water. Hard water in itself does not cause any impairment of infants' health. However sometimes it does affect the solubility of infant formula. With Humana Baby Water this won't happen.

Any opened packs of Humana Baby Water should be kept in the fridge. If the pack has been open for more than two days, boil the water before using. Small pale grey flakes may appear (flocculation of calcium), which are totally harmless to health. After one week you should dispose of any open packs.
