

FOR PREMATURE BABIES

For premature babies or babies with low birth weight, various ready-to-drink Humana formula for premature infants are used in clinics. They are perfectly adapted for the immature and therefore accordingly delicate organism of the baby.

For use at home – after discharge from the clinic – **Humana 0-HA** is available for babies under a normal weight of 3,500 g.

Humana 0-HA is a particularly rich infant formula, which prevents the risk of allergies in infants.

Humana 0-HA now has a new, perfected formulation. The energy density has been increased from 75 to 80 kcal/100 ml. At the same time the fatty acid composition has been adjusted in line with current scientific findings. The protein has greater bio-availability.
